

A security score tells you where an asset stands.

Not that it just moved.

CipherScan monitors the security posture of every digital asset you hold, against thresholds you set, and tells you the moment the picture changes.

THE PROBLEM

Security assessments for digital assets exist, and they are good. But they are a **snapshot you go and look up** — one asset at a time, when somebody remembers to check.

Posture decays quietly. Development stalls, governance concentrates, liquidity thins, an audit goes stale. None of it announces itself, and by the time it shows in the price it is late.

And the headline number barely separates anything. Established assets cluster tightly at the top, so a score alone is close to **no signal at all**.

What carries information is the direction it is moving, and which category underneath it is weak.

85–98

Where every established asset in a typical institutional portfolio scores. A single threshold either flags all of them or none.

WHAT CIPHERSCAN DOES

Scores continuously

Every asset you watch, every hour, across six categories — code, governance, community, fundamentals, market and resilience.

Watches your thresholds

You define what material means for your mandate. Policies evaluate against every holding automatically and raise an alert only when one is breached.

Reports on demand

A written assessment of the portfolio for any period, covering every asset, what moved and what was flagged — ready to put in front of a committee.

WHAT MAKES IT DIFFERENT

Direction over level

A fall from 96 to 92 matters. The absolute number still looks excellent, which is exactly why it gets missed.

Signal discipline

One alert per condition, held open while it persists. An inbox you still read in month six.

Category-level visibility

The headline score is an average. A single weak pillar hides comfortably inside a good one.

No custody, ever

No wallet connection, no keys, no signatures, no holdings recorded. Analysis only.

See it against your own portfolio.

We will set up a monitored watchlist and walk you through what it finds.
